Rubric bachelor’s thesis: social media and sleep quality

Each criterion receives a grade from 1 to 10.

Criterion	1 to 5	6 and 7	8 to 10
Introduction and hypotheses	Hypotheses do not follow logically from the literature or are not testable.	Clear problem statement and testable hypotheses that follow from theory.	Also a clear gap in the literature that this study addresses.
Design and instruments	Reliability or operationalisation missing.	Replicable design, validated instruments with reliability.	Also justified choices and a pre-specified analysis plan.
Sample and data handling	Recruitment, attrition or exclusion unclear, or numbers in the method and tables do not match.	Recruitment, exclusion and attrition described, numbers consistent throughout.	Also representativeness and power discussed.
Analysis and results	Incomplete reporting or interpretation within the results.	Appropriate analyses, fully reported in APA style, with a clear table.	Also assumptions checked and additional analyses where useful.
Discussion	Conclusions go beyond what the design allows, such as causal claims from correlational data.	Interpretation in line with the design, main limitations discussed.	Also alternative explanations and concrete further research.
Academic writing and APA	Frequently careless, or fewer sources than required (at least eight).	Clear academic English, APA largely correct.	Virtually error-free and precisely worded.
